Supplementary Material

Governing Procured AI: What Public Records Establish about Supplier Oversight and Responses

Supporting information for the accompanying anonymous manuscript. Tables S1–S8 trace sources, scope and interpretation boundaries; they do not constitute new independent samples or outcomes.

Public code and source-to-claim records: https://github.com/shaikhamalkawi-ux/governing-procured-ai-review. The 28-event and 140-check replay is deterministic, AI-assisted evidence coding, not independent human verification. The separate non-final scoping-screening checkpoint is not part of the documentary sample.

The appendices support the critical documentary review, not a systematically screened study database. They separate source selection, attributed statements, analytical roles and source dependencies. The original 28-event and nine-programme CSVs are unchanged. Fourteen current UK interpretations map to thirteen parent entries because one combined Kingston entry was split by attribution. The interpretation register also reports two retrospective cross-record checks involving chronology and legal identity. They do not change the 42 original-and-UK interpretations or create an outcome sample.

A Source selection and access

Selection was retrospective and purposive. Documents were retained for specific contrasts, not because they formed an exhaustive public-record universe. Tables S1 and S2 expose the reason for retaining each source. These reasons do not make the selected sources representative. The register's publication date is the document date, not necessarily an event date; unknown event times remain unknown. A local-authority timeline check demonstrates the temporal distinction, while a legal-identity check distinguishes a supplier trade name from a Companies House identifier.

Table S1: Four inherited primary documents, their analytical roles and current access.

Document	Selection reason	Access and interpretation boundary
GAO26: US Government Accountability Office (2026-04-13)	Acquisition/lifecycle contrasts plus agency-reported geospatial feedback; six programme examples deliberately selected from a larger audit, not exhaustively recoded.	Official HTML. Audit findings are not identical to all statements officials supplied to auditors. Source
VAGO26: Victorian Auditor-General (2026-06-10)	Contrasting operational supplier rollout and separate retention correction in one programme.	Official HTML. Auditor-linked archiving correction is not proof of a contractual cure or road-safety effect. Source

Document	Selection reason	Access and interpretation boundary
QAO25: Queensland Audit Office (2025-09-24)	Recurring vendor monitoring with positive qualitative assessment and ethical-risk limitations; the separate QChat analysis is not coded as another procurement case.	Official HTML. Recurring oversight is supported; no separately identified patch-effect estimate is established. Source
PHU25: Chen et al.; Public Health Ontario-hosted project report (2025-11-28)	Implementation-team account contrasting procurement preparation, supplier onboarding and buyer-led adaptation.	Indexed official PDF text; no fresh page-image authentication. Original indexed PDF text rechecked; image/raw-byte access unavailable. Summary/limitations report 44 interactions; findings narrative says 42. No independent denominator adjudication or effect recalculation. Source

The GAO programme examples are deliberately selected from a larger audit; they are not all its acquisitions or all its events. The Ontario report is authored by an implementation team and hosted by Public Health Ontario. Hosting does not make its workflow estimates independent audit findings.

Table S2: Seven UK documents retained as source contrasts, not seven independent acquisitions.

Document	Selection reason	Access
UK-WB: West Berkshire Council / GOV.UK (2025-01-28)	Negative acquisition-scope control: a production algorithm is not necessarily an externally procured model.	Official HTML. Source
UK-WAR: Warwickshire County Council / GOV.UK (2025-01-28)	Noncommercial acquisition-scope control, not a purchased AI contract.	Official HTML. Source
UK-NNC-N: North Northamptonshire Council / Find a Tender (2025-09-04)	Official signed-status and buyer/supplier/product linkage only.	Official HTML. Source
UK-NNC-C: North Northamptonshire Council and Beam Up Ltd (2025-09-03)	Published provisions and distinct audit objects; exercise not observed.	Indexed official PDF text; no fresh page-image authentication. Source
UK-KIN: Local Government Association / Kingston Council (2025-01-28)	Council-reported operational collaboration with differently attributed outcome statements.	Official HTML. Source
UK-CQC: Care Quality Commission (2026-03-04)	Staff experience within an independent institutional publication, not a separate outcome evaluation.	Indexed official HTML and report PDF text; no fresh page-image authentication. Source
UK-BEX: London Borough of Bexley / Find a Tender (2026-03-02)	Different-buyer same-product notice; tests against transferring another authority's evidence.	Indexed official PDF text; no fresh page-image authentication. Source

The North Northamptonshire notice, attached agreement and inspection account concern the same authority but different evidence objects. They do not establish a single remedy-to-effect episode. Bexley and Kingston are different public buyers of the same product family. West Berkshire and Warwickshire are acquisition-scope controls outside the purchased-tool subset. No cross-buyer or cross-period contractual rights are inferred.

A.1 Official cross-record checks beyond the seven-document UK set

The following sources were selected for targeted cross-record checks **after** the original interpretations were assembled. They do not enlarge the seven-document UK base set and do not create an unbiased holdout. Table S3 lists five official records: one concerns assessment chronology, and four concern the disclosed and awarded company identifiers. Previously admitted CQC, North Northamptonshire contract notice and Bexley documents remain linked from Table S2.

Table S3: Five official sources for two targeted cross-record probes.

Reference and source type	Directly supported fact	Key restriction
NNCASSESS — Council Health Scrutiny minutes, 2 July 2026	Assessment began February 2025 and concluded with site visit July 2025. Council minutes	Official indexed minutes; precisely timed Magic Notes staff interviews are not individually dated.
NCLATRS — Newcastle ATRS disclosure, 13 August 2026	Third-party field prints AWS company 09162820; named Amazon Q and Contact Lens. ATRS	Council-authored transparency declaration; company ID is not independently certified by publication.
NCLAWARD — Newcastle F03 award, 29 April 2025	Contractor AWS EMEA SARL UK, FC034225; Amazon Connect in parent service description. F03 award	Parent service scope; no automatic identification of AI-module-specific purchase.
CHAWSUK — Companies House registry	09162820 belongs to AWS (UK) LIMITED; SIC 71129, other engineering activities. Registry	Registry identifies a legal entity; distinctness does not by itself prove intent or wrongdoing.
CHAMAZON — Companies House registry	FC034225 belongs to AMAZON WEB SERVICES EMEA SARL. Registry	May be linked at corporate/brand level to other entities, but is not the same registered company number as 09162820.

Chronology. The CQC report was published on 4 March 2026, while the council describes the assessment as February–July 2025. The 3 September 2025 extension follows the documented assessment period. Because the individual Magic Notes staff statements have no separately observed dates, the report cannot support an assertion that the September extension was operating during their collection or caused their reported experience. The source may concern an earlier pilot; no inference is made that earlier contractual terms or later use were absent.

Identity. The Newcastle AI-use disclosure's company number 09162820 conflicts with the official parent-service award's FC034225. Registry resolution confirms distinct legal entities. The case is classified as *same public buyer and related platform, but incompatible registered contractor identifiers*. Neither publication is assumed fraudulent; the exact subcontractor and AI-module contractual boundaries remain for the buyer to clarify. The service award's £630k–£900k figures are offer values, not an audited single contract-price estimate. This finding is an official-register discrepancy, not an AI model-performance finding.

The three-row anti-join table in the main text adds the pre-existing Bexley-versus-North Northamptonshire separation as a third illustration, but only **two** targeted probes were added. Their pass/fail flags are logical checks of declared identifiers and dates, **not** sensitivity, specificity or validity statistics. The CSV contains the exact official URLs and missing-data statuses. No new raw user data, independent human coder or purchaser response is asserted.

A.2 Recheck scope and failed retrievals

The source recheck was conducted on 4 November 2026. Disputed and contribution-bearing passages were re-read; the inherited record set was not independently human-adjudicated. The source-access register records the original and later access bases. Indexed official text was readable when direct raw-byte downloads or web page-image rendering failed. These are separate capabilities: readable text does not prove visual authentication of a signature, table or page.

For the North Northamptonshire agreement and Ontario report, original indexed text remained readable while raw-byte and screenshot retrieval failed. The Bexley notice was read through its official PDF rendition, and the CQC passage through indexed official material and the full inspection report. Screenshot attempts for these two PDFs also failed. No source-image verification PASS is claimed. Fresh images of the supplied Cusenza manuscript were locally rendered for relevant pages; that private research copy is not redistributed.

The Ontario report has a descriptive total of 44 AI-scribe interactions but a narrative count of 42. Both are retained as a source conflict, not reconciled into an invented denominator. The two site-level time differences are source-specific descriptive measures, not a pooled estimate or an effect of contract enforcement.

A.3 Historical discovery register

The parent project describes a 2,556-identity bibliographic discovery register. That register was not fully screened for this article and is not the denominator of included studies, evidence completeness or source coverage. Licensed exports are not redistributed here. The companion Targeted_Recheck_Search_Log.csv records the targeted queries and access outcomes; it does not reconstruct missing historical search details or establish a completed systematic review.

B Interpretation codebook

Table S4 defines five non-ordinal analytical groups. They make inclusion roles explicit and cannot be summed into an accountability score. They are author-defined descriptive categories for this corpus, not a validated or exhaustive taxonomy.

Table S4: Analytical groups and decision boundaries.

Group	Meaning	Boundary
Operational account	Reported or auditor-documented review, feedback or supplier response during use.	Activity does not itself establish achieved accountability or effect.
Implementation experience	Implementation work, professional adaptation, staff testimony or local project measures.	Human workflow and project reports are not supplier-remedy causal evidence.
Acquisition provision	Award status, subscription scope or published contractual provision.	No presumption of exercised authority, completed trial or successful performance.
Scope control	An in-house or non-commercial example clarifying the acquisition boundary.	Outside the purchased-tool subset; not a contract failure.
Context	Predeployment/design/lifecycle or other context that limits interpretation.	Not counted as a deployed supplier correction.

Statement origin is a separate field: auditor account, agency account relayed by an auditor, staff account, project result, contractual text or official award notice. An independent publisher can relay an attributed account. The role table also identifies the acting party and the changed or measured object. Missing dates, denominators, versions and authority links are not supplied by another authority's record.

For each retained interpretation, the relevant source identifier and locator accompany a supported statement and an inference limit. These labels are AI-assisted interpretations. Deterministic checks test their internal consistency and provenance fields, not legal meaning, empirical accuracy or external validity.

C Inherited event interpretations

Table S5 gives a compact reading view of all 28 original events. The original CSV retains the complete original fields, dates and source locators. The analytical overlay records roles and qualifications without rewriting the source register. For example, the Queensland qualitative assessment of refinement and fairness remains part of the source interpretation even though no particular release-effect estimate is identified.

Table S5: Original event register: supported statements and prohibited substitutions.

Record and role	Retained source-derived statement	Inference limit
GEO-01 / GAO26 — Reported buyer feedback	FEMA officials said they relayed model classification problems; feedback was not recorded.	No observed model fix or measured accuracy gain.
GEO-02 / GAO26 — Vendor-service relationship	GAO reports further use of the geospatial vendor for a 12-month period.	Not proof of continuing geospatial AI use as of February 2026.
GEO-03 / GAO26 — AI programme lifecycle	DHS officials said geospatial damage-assessment AI was retired and no longer used at FEMA.	Not proof of vendor contract termination, penalty, or accuracy improvement.
GEO-04 / GAO26 — Rights and scope constraint	Officials said missing rights prevented sharing geospatial model outputs with partners.	Not proof other GAO programs had the same data-rights issue.
PARC-01 / GAO26 — Contract authority; deployment unresolved here	FEMA officials said their reused contract could not compel the desired post-award testing.	Absence of contractual power is not evidence that vendor actually tested.
PARC-02 / GAO26 — Programme lifecycle	DHS officials said planning-assistance AI had been retired and was not used at FEMA.	No cause of retirement or vendor penalty is established.
SOKAT-01 / GAO26 — Retirement before production	VA stopped SoKAT before production because incremental benefit did not justify its cost.	No deployed clinical outcome or supplier breach demonstrated.
SOKAT-02 / GAO26 — Knowledge capture	VA officials did not record lessons from the SoKAT decision.	Do not infer actual future acquisition decisions were affected.
MAVEN-01 / GAO26 — Follow-on contract design	NGA officials said subsequent contracts gained clearer AI deliverable and performance terms.	Not observed remedial action by the initial contractor.
XM30-01 / GAO26 — Preaward proposal	Army officials rejected a proposed AI license price near USD 300,000 per vehicle-year.	Neither executed expenditure nor postaward sanction.
USAI-01 / GAO26 — Contract design	GSA developed data-ownership and vendor chat-access restrictions in USAi terms.	Contract terms do not show an exercised right or postaward corrective action.

Record and role	Retained source-derived statement	Inference limit
USAI-02 / GAO26 — Preaward testing	GSA officials described tests of models before multiyear USAi procurement commitments.	Do not attribute a later measured outcome to this testing.
VIC-01 / VAGO26 — Limited supplier trial	Jenoptik trialled an approved AI update on two cameras in 2024.	Missing post-May 2024 version records prevent release-trace closure.
VIC-02 / VAGO26 — Supplier rollout	Independent test preceded buyer approval; Jenoptik rolled out software to all cameras.	Auditor said performance effect too early to assess.
VIC-03 / VAGO26 — Audit-linked compliance correction	Jenoptik changed image archiving and deletion after audit concerns about over-retention.	Not an AI algorithm change or contractual sanction.
VIC-04 / VAGO26 — Oversight and verification limit	Of 22 contractual KPIs, 21 applied; some self-reports lacked buyer verification.	KPI existence is not assurance that all performance values were validated.
VIC-05 / VAGO26 — Outcome-evaluation limitation	Auditor found no reliable basis yet to attribute fewer injuries or deaths to programme.	Enforcement volumes do not demonstrate attributed road safety benefits.
QLD-01 / QAO25 — Contractual performance monitoring	External vendor contract included KPIs assessing AI photo-screening accuracy.	No specific supplier repair follows automatically.
QLD-02 / QAO25 — Routine reviews and feedback	TMR conducts weekly audits and quarterly reviews; QRO feedback reaches the vendor.	Feedback transmission does not prove deployment of a particular version. Auditor also says the processes support refinements, accuracy and fairness; this positive qualitative assessment is retained without inventing a dated release or an isolated effect.
QLD-03 / QAO25 — Workflow measure	AI screened out 98.7% of 208.4 million assessments from vendor human review.	Assessments are not unique drivers and filter rate is not a before-after effect.
QLD-04 / QAO25 — Governance limitation	TMR had not completed a dedicated ethical risk assessment for MPST.	Other controls do not imply comprehensive ethical risk assurance.
PHU-01 / PHU25 — Vendor selection	Two public health units compared vendors with demonstrations and selection criteria.	Vendor selection is not later supplier enforcement.
PHU-02 / PHU25 — Contract design	Legal review addressed data ownership, residency, breach response and subcontractor duties.	Negotiation does not establish that a contract remedy was exercised.
PHU-03 / PHU25 — Pilot use	Fifteen licenses were used in two public health units during a pilot.	Licenses are not number of procurement contracts or independent studies.
PHU-04 / PHU25 — Initial support	Vendor provided tool-specific onboarding and technical training.	Training is not vendor repair in response to a demonstrated failure.
PHU-05 / PHU25 — Buyer adaptation	Public health staff continued template refinements after initial vendor support decreased.	Do not classify buyer-created templates as supplier remediation.

Record and role	Retained source-derived statement	Inference limit
PHU-06 / PHU25 — Reported site-level time measures	Reported mean documentation time was 12.9 minutes shorter at SMDHU and 10.3 longer at WDGPH.	Not a causal vendor-accountability effect; do not pool sites or extrapolate from 44 interactions.
PHU-07 / PHU25 — Measurement limitation	Authors report 44 AI-scribe interactions and limited generalizability.	Do not invent a unit-specific interaction allocation or causal effect. Source total 44 conflicts with narrative 42; do not reconstruct denominators.

This table has 28 descriptions, not 28 independent cases. Multiple rows concern the same programme and source. A retirement statement is not a penalty; a supplier release is not a measured effect; and a local workflow result is not the effect of an exercised contractual remedy. Exact source locators are exposed in the distributed CSV and the interpretation-role table.

D Corrected UK statement register

Table S6 retains the UK extension separately. The parent UK10 combined two distinct origins: social workers' reported time savings and a project-level transcription-accuracy result. UK10a and UK10b separate those origins without changing the percentages or adding an observation. The companion package preserves the thirteen-row parent CSV and the fourteen-row crosswalk.

Table S6: Fourteen UK interpretations from thirteen parent entries.

Record	Source-derived interpretation	Inference limit and locator
UK01 / UK-WB — West Berkshire	Tool was built internally on a supplied digital platform; no procurement specific to the tool. Origin: Authority disclosure.	Treating an algorithmic disclosure or platform supplier as a purchased AI model. Locator: fields 1.4.3-1.4.4.
UK02 / UK-WAR — Warwickshire	Model outputs are provided on a non-commercial basis from a staff-originated personal project. Origin: Authority disclosure.	Equating external involvement with a paid AI procurement. Locator: fields 1.4.1-1.4.4.
UK03 / UK-NNC-N — North Northamptonshire	Notice reports signature on 3 September 2025, £48,000 excluding VAT, term 8 September 2025 to 7 September 2026. Origin: Official procurement record.	Treating notice status as proof that a remedy was exercised. Locator: Contract 1.
UK04 / UK-NNC-N — North Northamptonshire	Notice supplies Companies House identifier 10637337, also printed in the attached agreement. Origin: Official procurement record.	Joining a different public buyer solely because the supplier or product matches. Locator: Supplier; compare attachment p.3.
UK05 / UK-NNC-C — North Northamptonshire	Clause 7.2 sets a conditional supplier correction undertaking linked to clause 7.1. Origin: Published contract text.	Inferring a dated cure request, forced release, or error-free guarantee. Locator: p.7, clauses 7.1-7.3.
UK06 / UK-NNC-C — North Northamptonshire	Data-processing schedule 6.4-6.5 allows specified compliance inspections subject to procedures. Origin: Published contract text.	Treating a data-processing audit provision as an unlimited model-benchmarking permission. Locator: pp.16-17, schedule 6.

Record	Source-derived interpretation	Inference limit and locator
UK07 / UK-NNC-C — North Northamptonshire	The general-terms preamble restricts access for monitoring performance or benchmarking purposes. Origin: Published contract text.	Offering a legal opinion on enforceability or proving that all lawful oversight is prohibited. Locator: p.3, preamble.
UK08 / UK-NNC-C — North Northamptonshire	The order specifies 11,900 recording hours, 100 reports and monthly bundle-usage reporting. Origin: Published contract text.	Counting subscribed capacity as hours actually used or saved. Locator: pp.1-2, order form.
UK09 / UK-KIN — Kingston	The case narrative reports supplier features addressing background noise and a recurring feedback process. Origin: Council case narrative.	Inferring that North Northamptonshire's clause 7.2 compelled the Kingston changes. Locator: AI governance; Challenges and limitations.
UK10a / UK-KIN — Kingston	Social workers reported an average 50–60% reduction in completing case notes and assessments. Origin: Social workers, attributed in council narrative.	Treating self-reported time savings as an independently measured or remedy-caused effect. Locator: Initial impact.
UK10b / UK-KIN — Kingston	The council case narrative presents transcription accuracy above 96% as a project result, against an initial 85% target. Origin: Project result, reported in council narrative.	Attributing the accuracy result to staff testimony or treating it as independently validated without a denominator, scoring rule or release-specific comparison. Locator: Initial impact.
UK11 / UK-KIN — Kingston	Social workers reportedly revise transcripts and summaries; template adjustment and training continue. Origin: Council case narrative.	Assigning every workflow improvement to a supplier model release. Locator: AI governance; Initial impact.
UK12 / UK-CQC — North Northamptonshire	CQC records staff reports of clearer, more consistent and efficient records. Origin: Staff testimony attributed by CQC.	Treating the inspection as independent validation of a numerical throughput or capacity effect. Locator: Continuous learning, digital innovation paragraph.
UK13 / UK-BEX — Bexley	Notice reports a £30,000 excluding VAT trial signed 1 February 2026, ending 30 April 2026. Origin: Official signed-status notice; no deployment result.	Transferring terms, oversight events or outcomes from another council. Locator: Contract 1; buyer.

The Kingston case narrative supplies neither a transcript-scoring denominator nor an independent release-specific effect design. Separating the two origins prevents treating all favourable figures as staff testimony or all of them as independently measured outcomes. No corrective right from North Northamptonshire is transferred to Kingston or Bexley.

E Dependency and alternative-explanation map

Table S7 records which descriptions share a publication, programme or supplier context. This map is not a statistical sensitivity analysis, an evidence-quality score or an accuracy estimate. Removing the

Victoria source removes both its software-rollout and retention-correction accounts; retaining another kind of source does not independently replicate them.

Table S7: Selected source and programme dependencies.

Evidence profile	Linked records / sources	Dependency implication
Vic Software	VIC-01;VIC-02 / VAGO26	Testing and rollout only; both events share a programme and source
Vic Retention	VIC-03 / VAGO26	Auditor-linked retention correction; not independent replication of software rollout benefit
Qld Reviews	QLD-01;QLD-02;QLD-04 / QAO25	Routine monitoring and governance limitation in same audit
Phu Adaptation	PHU-03;PHU-04;PHU-05;PHU-06;PHU-07 / PHU25	Project-team evidence and unresolved quantitative source conflict
Kingston Collaboration	UK09;UK10a;UK10b;UK11 / UK-KIN	One council narrative; time and accuracy have different attributed origins, not independent studies
Nnc Terms	UK03; UK04; UK05; UK06; UK07; UK08 / UK-NNC-N;UK-NNC-C	Notice and attached agreement are linked publication records, not independent outcome evidence
Nnc Testimony	UK12 / UK-CQC	Staff account in inspection; exact mapping to a contract variation or service subgroup unresolved
Bexley Control	UK13 / UK-BEX	Same supplier/product as NNC and Kingston; no transfer of terms or outcome results
Acquisition Controls	UK01;UK02 / UK-WB;UK-WAR	Alternative examples of scope mismatch; not contract failures
Fema Feedback	GEO-01;GEO-02;GEO-03;GEO-04 / GAO26	Agency accounts within audit; vendor continuation and AI retirement must not be merged

Absence of a public remedy notice is compatible with no relevant defect, informal/private resolution, or unpublished formal enforcement. A favourable outcome account can also combine software, staff review, training, configuration and other service changes. The documents do not distinguish all these alternatives. The review therefore makes a bounded statement about documentary support, not about the real-world nonoccurrence of oversight.

F Closest prior work and originality boundary

Table S8 documents a selected comparison with close research and assurance precedents. The three empirical additions concern city procurement practice, vendor self-disclosures and NHS deployment. They strengthen contextual coverage but do not become new cases in the primary documentary register. No claim is made that the comparison is exhaustive or that earlier research lacks operational or post-deployment examples.

Table S8: Selected prior-work comparison.

Work / design	Relevant overlap	Consulted basis
COG — Normative/legal design	Contractual algorithmic accountability. Contracts can address accountability; not invented here	The cited legal/conceptual work provides prior contractual accountability theory. Reference
CUSENZA — Purposive contract analysis	Contract clauses, amendments and operational dispute. Close overlap includes post-implementation testing and defect provisions; not abstract-only	User-supplied PDF pp.2–4,32–33,48–50; local text and selected page images. Reference
JOHNSON — Interview-based empirical study	19 employees across seven US cities. Buyer-led evaluation and ongoing governance responsibilities precede this review	Author HTML sec.5.3; official FAccT publication text and DOI. Reference
KUEHNERT — Empirical disclosure study	39 FactSheets plus stakeholder interviews. Self-disclosure alone is not adequate evaluation; relational use may be useful	Preprint v1 consulted; FAccT 2026 DOI and publication pages separately verified. Reference
RAMSAY — Mixed-method implementation evaluation	Procurement and early deployment in NHS chest diagnostics. Organisational and technical work already documented empirically	Institutional author copy abstract and methods; PDF text; screenshot failed. Reference
ICO — Assurance guidance	Claims, arguments and evidence. Evidence gates and traceability are established assurance ideas	Official claims–arguments–evidence guidance. Reference
FACCT — Software-supported assurance	Evidence collection for AI fairness assurance. Executable evidence handling is not itself new	Published prior method; comparison is conceptual rather than an independent benchmark. Reference
ABDULBARI — Legal/conceptual proposal	Traceability and corrective governance. Event documentation is not a first-in-field idea	Published prior method; comparison is conceptual rather than an independent benchmark. Reference
NISTMON — Technical guidance/report	Monitoring deployed AI systems. Multiple monitoring endpoints and barriers are established context	Published prior method; comparison is conceptual rather than an independent benchmark. Reference
HARDY — Documentary oversight framework	Purposive O2C analysis of 19 public AI cases and 41 evidence statements; nominal human oversight is not effective control	Publisher article metadata and abstract only (15 October 2026). Full text not independently audited. Reference

Cusenza is not merely a contract-checklist comparator: the supplied manuscript discusses operational disputes and post-implementation monitoring and defects. Johnson and colleagues already analyse post-deployment evaluation responsibility; Kuehnert and colleagues already question the evidential value of vendor disclosures; Ramsay and colleagues already examine procurement and implementation work. Hardy contributes a close documentary-oversight precedent, further limiting claims of methodological priority. The contribution is therefore an incremental, procurement-specific synthesis across source types, legal parties, observation times and audit objects. It is neither a first-of-its-kind accountability framework nor an independently validated coding method.

G Cross-record interpretation controls

Two previously tempting cross-record inferences were ruled inadmissible. A report published after a particular contract cannot establish that its otherwise undated staff statements were collected during that contract; and a shared trade name does not certify the same legal contractor when company identifiers differ. Both checks are limited to named source records. They do not estimate error frequencies, certify original PDF signatures, or independently validate human-coded truth. The original event descriptions and cited official sources are preserved.

H Reproduction and inspection

The companion source-to-claim register separates attributed interpretations from deterministic summaries. Its machine-readable files retain 28 event descriptions, nine programme families, fourteen UK interpretations and two separately described cross-record checks. Source and output integrity can be checked with a SHA-256 manifest. Re-running structural checks verifies the recorded inputs and processing operations, not the truth of the underlying administrative assertions.

The reproducibility scripts do not retrieve or reinterpret web evidence, provide legal opinions, or independently adjudicate extracted statements. Successful execution supports reproducibility of the supplied inputs and operations only. The companion verification log records structural tests and extraction checks. When page-image retrieval of a primary document did not succeed, its text is classified as indexed source text rather than visually authenticated evidence.

The historical event and programme extracts remain separately archived. Preservation of earlier files does not imply that every historical software test has been rerun. No human coder, agreement statistic, causal effect, new survey participant, new primary acquisition or independent method-performance estimate was added. Optional information requests remain unsent and outside this paper’s results.
